

Sequence Management Services

Here at Computype, we prioritize the importance of sequence management. In the industries we supply, the threat of duplicate labels could be life changing which is why we've developed a proprietary system to ensure we prevent that from occurring. Our Sequence Management Services start in a database that allows tracking of sequential numbers printed on labels, so ranges are able to be accurately tracked.

Computype plays a large role in the Transfusion Medicine industry. In this business, if a label were to be duplicated it could quite literally result in a crisis. It is important that donated blood is perfectly and accurately tracked to ensure it can be safely utilized when needed. If blood bags become unidentifiable, they are essentially a wasted donation as they cannot be traced back. Through utilization of sequence management, sequences are traceable by part number, individual organization, or transfusion medicine processing center in cases of multiple locations. If a center has multiple locations, we have the ability to group all locations together and track the sequences to ensure no duplicate numbers.

Libraries also rely heavily on sequences. In many cases, libraries want to keep all sequences tracked together from locations within a certain geographic region, ensuring no serial number duplication. Computype is able to group different companies or locations together and keep track of the records as compared to each other. For libraries with multiple locations, we will both print labels and track sequences for all locations within the network, or we can print for some locations while still keeping track of all sequences including locations that print remotely. This allows each individual location to be aware of previously used sequences.

Sequence management is also imperative in the tire manufacturing industry. Here, we are able to identify tire manufactures with a specification number, and then all locations within will be grouped into one centralized sequence pool ensuring no duplicate serial numbers. As tire companies are usually global, a service like Computype's is the most accurate and efficient way to guarantee the integrity of products.

These are just a few examples of how sequence management is utilized, however the service could be beneficial to many additional types of businesses and processes. Computype is able to identify companies or industries through a specification number and have access to their sequence number records indefinitely. We are proud to provide this service offering and ensure our customers can safely and accurately track assets of value.
