

# Simplify in vivo sample identification and collection with pre-labeled labware.

## We provide the labware, you provide the research.

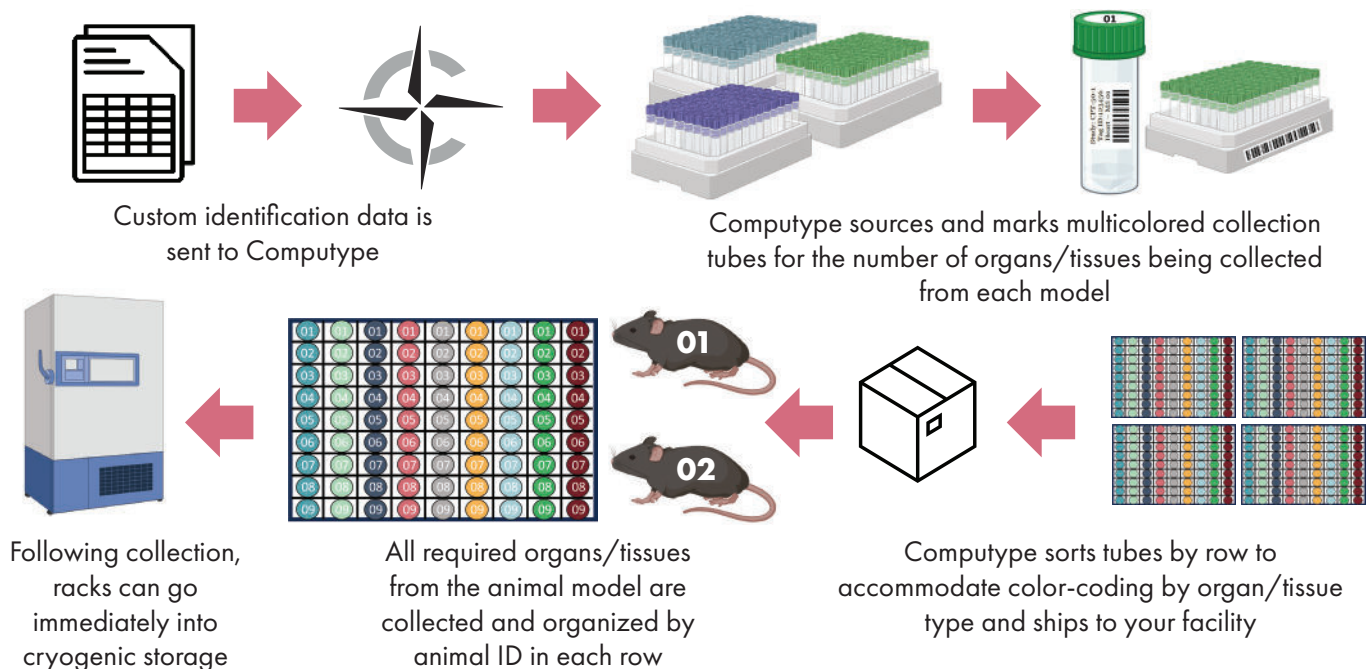

Proper identification of samples collected from animal models is critical, but manually labelling collection tubes is inefficient and prone to human error. Misidentified samples can become unusable, thus wasting valuable resources and losing critical data.

## By receiving pre-labeled collection tubes and labware, you can:

- Stop losing tubes. One customer reported losing up to 60% of hand-marked tubes and eliminated this waste using Computype's pre-labeled labware.\*
- Guarantee label integrity and legibility at cryogenic temperatures.
- Support trial organization with labware that can be color-coded, packaged, and sequenced to support custom schedules and collection methods.
- Streamline labware preparation for takedowns and dissections.

## How it works.

You provide Computype with your required data fields, sequence ranges, color-coding requirements, and ideal packaging. Computype prepares your **collection tubes** to your marking specifications and deliver them ready to use.
